

# e-TAP. Our new environmental label.

To date, we have concentrated on giving you access to fresh, clean water from an attractive mixer. We have now devoted some time to working out how to keep the water this way.

*The solution is called "e-TAP", which is our new environmental label.*

When you buy a mixer that bears the e-TAP label, you can be sure that it lives up to very stringent requirements for environmental friendliness. This applies to everything from manufacture, recycling and emissions to water and energy-saving functions.

## Water-saving technology

Nautic features modern, easy-to-use water-saving technology that means you need not use more water than necessary. When the level is in its "original" position, the mixer supplies a sufficient flow to do the dishes or wash your hands. To access full flow, simply lift the lever to the highest position – when released it automatically returns to the original position.

## Energy-saving technology

Saving energy is also important for the environment. That is why Nautic features a revolutionary energy-saving function that allows you to cut your energy consumption by up to 50% the solution is just as simple as it is smart: you have to move the lever all the way to the left to reach maximum water temperature. This function helps you to save a lot of energy – and money – every year.

## Soft Pex

Soft Pex is the name of a new type of approved connection hoses that are made – using environmentally friendly methods – of corrosion resistant and recyclable material. The hoses have a long service life, are remarkably flexible, and are simple to fit. So say goodbye to cutting or bending connection pipes.

## WRC approved

Nautic is WRC approved. This means that all the components used are made of "food approved" materials. Which, in turn, means that there is nothing in the mixer that has a negative effect on the water quality. Cool or what?

## Soft closing

Nautic is fitted with a "shock absorber" that prevents you from causing shock-waves in the pipes every time you turn the water off. In the most extreme cases, such shocks can cause leaks, so "soft closing" as standard means good protection. For you and the environment.

## Nordic Quality label

Nautic also bears the Nordic Quality label. This label shows that you can be sure that the mixer is of the highest quality, and that you will receive the best possible service. Nordic Quality is the quality labelling section of the independent organisation INSTACERT. To be allowed to use this label on its products, manufacturers have to live up to a range of very stringent requirements on aspects such as production, service, access to parts, guarantees and delivery terms.

## Environmentally friendly

The requirements on the actual manufacture of Nautic are high, too. Emissions from the manufacturing process are minimal, material consumption is kept at a low level, and no environmentally hazardous substances are used. The demands on mixers bearing the e-TAP label do not end when the mixers reach the end of their – impressive – service lives. It has to be possible to recover the materials they are made of – without having an impact on the environment.

*So choose the e-TAP labelled Nautic mixer. For the sake of the environment – and your wallet.*
